PYRAZOLE COMPOUNDS USEFUL AS PROTEIN KINASE INHIBITORSCROSS REFERENCE TO RELATED APPLICATIONS

This application claims priority to US Provisional Patent Application 60/257,887 filed December 21, 2000 and US Provisional Patent Application 60/286,949 filed April 27, 2001, the contents of which are incorporated herein by reference.

FIELD OF THE INVENTION

The present invention is in the field of medicinal chemistry and relates to compounds that are protein kinase inhibitors, compositions containing such compounds and methods of use. More particularly, this 5 invention relates to compounds that are inhibitors of Aurora-2 protein kinase. The invention also relates to methods of treating diseases associated with protein kinases, especially diseases associated with Aurora-2, such as cancer.

10

BACKGROUND OF THE INVENTION

The search for new therapeutic agents has been greatly aided in recent years by better understanding of the structure of enzymes and other biomolecules 15 associated with target diseases. One important class of enzymes that has been the subject of extensive study is the protein kinases.

Protein kinases mediate intracellular signal transduction. They do this by effecting a phosphoryl 20 transfer from a nucleoside triphosphate to a protein acceptor that is involved in a signaling pathway. There are a number of kinases and pathways through which

-2-

extracellular and other stimuli cause a variety of cellular responses to occur inside the cell. Examples of such stimuli include environmental and chemical stress signals (e.g. osmotic shock, heat shock, ultraviolet 5 radiation, bacterial endotoxin,  $H_2O_2$ ), cytokines (e.g. interleukin-1 (IL-1) and tumor necrosis factor  $\alpha$  (TNF- $\alpha$ )), and growth factors (e.g. granulocyte macrophage-colony-stimulating factor (GM-CSF), and fibroblast growth factor (FGF)). An extracellular stimulus may effect one 10 or more cellular responses related to cell growth, migration, differentiation, secretion of hormones, activation of transcription factors, muscle contraction, glucose metabolism, control of protein synthesis and regulation of cell cycle.

15 Many diseases are associated with abnormal cellular responses triggered by protein kinase-mediated events. These diseases include autoimmune diseases, inflammatory diseases, neurological and neurodegenerative diseases, cancer, cardiovascular diseases, allergies and 20 asthma, Alzheimer's disease or hormone-related diseases. Accordingly, there has been a substantial effort in medicinal chemistry to find protein kinase inhibitors that are effective as therapeutic agents.

Aurora-2 is a serine/threonine protein kinase 25 that has been implicated in human cancer, such as colon, breast and other solid tumors. This kinase is believed to be involved in protein phosphorylation events that regulate the cell cycle. Specifically, Aurora-2 may play a role in controlling the accurate segregation of 30 chromosomes during mitosis. Misregulation of the cell cycle can lead to cellular proliferation and other abnormalities. In human colon cancer tissue, the aurora-2 protein has been found to be overexpressed. See

Glycogen synthase kinase-3 (GSK-3) is a serine/threonine protein kinase comprised of  $\alpha$  and  $\beta$  isoforms that are each encoded by distinct genes [Coghlan et al., *Chemistry & Biology*, 7, 793-803 (2000); Kim and Kimmel, *Curr. Opinion Genetics Dev.*, 10, 508-514 (2000)]. GSK-3 has been implicated in various diseases including diabetes, Alzheimer's disease, CNS disorders such as manic depressive disorder and neurodegenerative diseases, and cardiomyocyte hypertrophy [WO 99/65897; WO 00/38675; and Haq et al., *J. Cell Biol.* (2000) 151, 117]. These diseases may be caused by, or result in, the abnormal operation of certain cell signaling pathways in which GSK-3 plays a role. GSK-3 has been found to phosphorylate and modulate the activity of a number of regulatory proteins. These proteins include glycogen synthase which is the rate limiting enzyme necessary for glycogen synthesis, the microtubule associated protein Tau, the gene transcription factor  $\beta$ -catenin, the translation initiation factor eIF2B, as well as ATP citrate lyase, axin, heat shock factor-1, c-Jun, c-Myc, c-Myb, CREB, and CEPB $\alpha$ . These diverse protein targets implicate GSK-3 in many aspects of cellular metabolism, proliferation, differentiation and development.

In a GSK-3 mediated pathway that is relevant for the treatment of type II diabetes, insulin-induced signaling leads to cellular glucose uptake and glycogen synthesis. Along this pathway, GSK-3 is a negative regulator of the insulin-induced signal. Normally, the presence of insulin causes inhibition of GSK-3 mediated

-4-

phosphorylation and deactivation of glycogen synthase. The inhibition of GSK-3 leads to increased glycogen synthesis and glucose uptake [Klein et al., *PNAS*, 93, 8455-9 (1996); Cross et al., *Biochem. J.*, 303, 21-26 (1994); Cohen, *Biochem. Soc. Trans.*, 21, 555-567 (1993); Massillon et al., *Biochem J.* 299, 123-128 (1994)]. However, in a diabetic patient where the insulin response is impaired, glycogen synthesis and glucose uptake fail to increase despite the presence of relatively high blood levels of insulin. This leads to abnormally high blood levels of glucose with acute and long term effects that may ultimately result in cardiovascular disease, renal failure and blindness. In such patients, the normal insulin-induced inhibition of GSK-3 fails to occur. It has also been reported that in patients with type II diabetes, GSK-3 is overexpressed [WO 00/38675]. Therapeutic inhibitors of GSK-3 therefore are considered to be useful for treating diabetic patients suffering from an impaired response to insulin.

GSK-3 activity has also been associated with Alzheimer's disease. This disease is characterized by the well-known  $\beta$ -amyloid peptide and the formation of intracellular neurofibrillary tangles. The neurofibrillary tangles contain hyperphosphorylated Tau protein where Tau is phosphorylated on abnormal sites. GSK-3 has been shown to phosphorylate these abnormal sites in cell and animal models. Furthermore, inhibition of GSK-3 has been shown to prevent hyperphosphorylation of Tau in cells [Lovestone et al., *Current Biology* 4, 1077-86 (1994); Brownlees et al., *Neuroreport* 8, 3251-55 (1997)]. Therefore, it is believed that GSK-3 activity may promote generation of the neurofibrillary tangles and the progression of Alzheimer's disease.

-5-

Another substrate of GSK-3 is  $\beta$ -catenin which is degraded after phosphorylation by GSK-3. Reduced levels of  $\beta$ -catenin have been reported in schizophrenic patients and have also been associated with other 5 diseases related to increase in neuronal cell death [Zhong et al., *Nature*, 395, 698-702 (1998); Takashima et al., *PNAS*, 90, 7789-93 (1993); Pei et al., *J. Neuropathol. Exp.*, 56, 70-78 (1997)].

As a result of the biological importance of 10 GSK-3, there is current interest in therapeutically effective GSK-3 inhibitors. Small molecules that inhibit GSK-3 have recently been reported [WO 99/65897 (Chiron) and WO 00/38675 (SmithKline Beecham)].

For many of the aforementioned diseases 15 associated with abnormal GSK-3 activity, other protein kinases have also been targeted for treating the same diseases. However, the various protein kinases often act through different biological pathways. For example, certain quinazoline derivatives have been reported 20 recently as inhibitors of p38 kinase (WO 00/12497 to Scios). The compounds are reported to be useful for treating conditions characterized by enhanced p38- $\alpha$  activity and/or enhanced TGF- $\beta$  activity. While p38 activity has been implicated in a wide variety of 25 diseases, including diabetes, p38 kinase is not reported to be a constituent of an insulin signaling pathway that regulates glycogen synthesis or glucose uptake. Therefore, unlike GSK-3, p38 inhibition would not be 30 expected to enhance glycogen synthesis and/or glucose uptake.

There is a continued need to find new therapeutic agents to treat human diseases. The protein

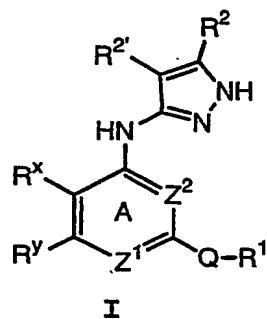

- 6 -

kinases Aurora-2 and GSK-3 are especially attractive targets for the discovery of new therapeutics due to their important roles in cancer and diabetes, respectively.

As used herein, the following definitions shall apply unless otherwise indicated. The phrase "optionally substituted" is used interchangeably with the phrase "substituted or unsubstituted" or with the term "(un)substituted." Unless otherwise indicated, an optionally substituted group may have a substituent at

-10-

each substitutable position of the group, and each substitution is independent of the other.

The term "aliphatic" as used herein means straight-chain, branched or cyclic C<sub>1</sub>-C<sub>12</sub> hydrocarbons which are completely saturated or which contain one or more units of unsaturation but which are not aromatic. For example, suitable aliphatic groups include substituted or unsubstituted linear, branched or cyclic alkyl, alkenyl, alkynyl groups and hybrids thereof such as (cycloalkyl)alkyl, (cycloalkenyl)alkyl or (cycloalkyl)alkenyl. The terms "alkyl", "alkoxy", "hydroxyalkyl", "alkoxyalkyl", and "alkoxycarbonyl", used alone or as part of a larger moiety includes both straight and branched chains containing one to twelve carbon atoms. The terms "alkenyl" and "alkynyl" used alone or as part of a larger moiety shall include both straight and branched chains containing two to twelve carbon atoms. The term "cycloalkyl" used alone or as part of a larger moiety shall include cyclic C<sub>3</sub>-C<sub>12</sub> hydrocarbons which are completely saturated or which contain one or more units of unsaturation, but which are not aromatic.

The terms "haloalkyl", "haloalkenyl" and "haloalkoxy" means alkyl, alkenyl or alkoxy, as the case may be, substituted with one or more halogen atoms. The term "halogen" means F, Cl, Br, or I.

The term "heteroatom" means nitrogen, oxygen, or sulfur and includes any oxidized form of nitrogen and sulfur, and the quaternized form of any basic nitrogen. Also the term "nitrogen" includes a substitutable nitrogen of a heterocyclic ring. As an example, in a saturated or partially unsaturated ring having 0-3 heteroatoms selected from oxygen, sulfur or nitrogen, the

-11-

nitrogen may be N (as in 3,4-dihydro-2H-pyrrolyl), NH (as in pyrrolidinyl) or NR<sup>+</sup> (as in N-substituted pyrrolidinyl).

The terms "carbocycle", "carbocyclyl",

5 "carbocyclo", or "carbocyclic" as used herein means an aliphatic ring system having three to fourteen members. The terms "carbocycle", "carbocyclyl", "carbocyclo", or "carbocyclic" whether saturated or partially unsaturated, also refers to rings that are optionally substituted.

10 The terms "carbocycle", "carbocyclyl", "carbocyclo", or "carbocyclic" also include aliphatic rings that are fused to one or more aromatic or nonaromatic rings, such as in a decahydronaphthyl or tetrahydronaphthyl, where the radical or point of attachment is on the aliphatic ring.

15 The term "aryl" used alone or as part of a larger moiety as in "aralkyl", "aralkoxy", or "aryloxyalkyl", refers to aromatic ring groups having five to fourteen members, such as phenyl, benzyl, phenethyl, 1-naphthyl, 2-naphthyl, 1-anthracyl and 2-anthracyl. The term "aryl" also refers to rings that are optionally substituted. The term "aryl" may be used interchangeably with the term "aryl ring". "Aryl" also includes fused polycyclic aromatic ring systems in which an aromatic ring is fused to one or more rings. Examples 20 include 1-naphthyl, 2-naphthyl, 1-anthracyl and 2-anthracyl. Also included within the scope of the term "aryl", as it is used herein, is a group in which an aromatic ring is fused to one or more non-aromatic rings, such as in an indanyl, phenanthridinyl, or 25 tetrahydronaphthyl, where the radical or point of attachment is on the aromatic ring.

30 The term "heterocycle", "heterocyclyl", or "heterocyclic" as used herein includes non-aromatic ring

The term "heterocycle", "heterocyclyl", or "heterocyclic" as used herein includes non-aromatic ring

This invention also envisions the quaternization of any basic nitrogen-containing groups of the compounds 25 disclosed herein. Water or oil-soluble or dispersible products may be obtained by such quaternization.

The amount of the protein kinase inhibitor that may be combined with the carrier materials to produce a single dosage form will vary depending upon the patient 30 treated and the particular mode of administration. Preferably, the compositions should be formulated so that a dosage of between 0.01 - 100 mg/kg body weight/day of

-30-

the inhibitor can be administered to a patient receiving these compositions.

It should also be understood that a specific dosage and treatment regimen for any particular patient 5 will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity 10 of the particular disease being treated. The amount of the inhibitor will also depend upon the particular compound in the composition.

Depending upon the particular protein kinase-mediated condition to be treated or prevented, additional 15 therapeutic agents, which are normally administered to treat or prevent that condition, may be administered together with the inhibitors of this invention. For example, in the treatment of cancer other chemotherapeutic agents or other anti-proliferative 20 agents may be combined with the present compounds to treat cancer. These agents include, without limitation, adriamycin, dexamethasone, vincristine, cyclophosphamide, fluorouracil, topotecan, taxol, interferons, and platinum derivatives.

25 Other examples of agents the inhibitors of this invention may also be combined with include, without limitation, agents for treating diabetes such as insulin or insulin analogues, in injectable or inhalation form, glitazones, alpha glucosidase inhibitors, biguanides, 30 insulin sensitizers, and sulfonyl ureas; anti-inflammatory agents such as corticosteroids, TNF blockers, IL-1 RA, azathioprine, cyclophosphamide, and sulfasalazine; immunomodulatory and immunosuppressive

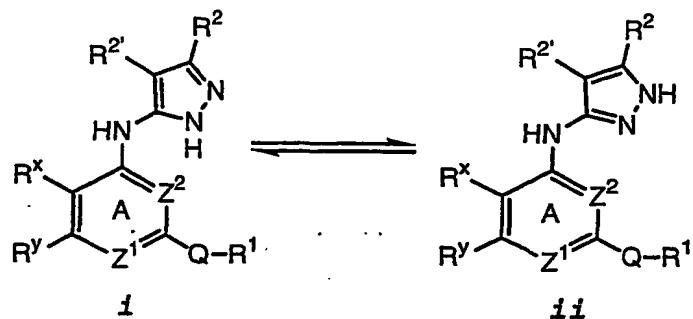

-31-

agents such as cyclosporin, tacrolimus, rapamycin, mycophenolate mofetil, interferons, corticosteroids, cyclophosphamide, azathioprine, and sulfasalazine; neurotrophic factors such as acetylcholinesterase 5 inhibitors, MAO inhibitors, interferons, anti-convulsants, ion channel blockers, riluzole, and anti-Parkinsonian agents; agents for treating cardiovascular disease such as beta-blockers, ACE inhibitors, diuretics, nitrates, calcium channel blockers, and statins; agents 10 for treating liver disease such as corticosteroids, cholestyramine, interferons, and anti-viral agents; agents for treating blood disorders such as corticosteroids, anti-leukemic agents, and growth factors; and agents for treating immunodeficiency 15 disorders such as gamma globulin.

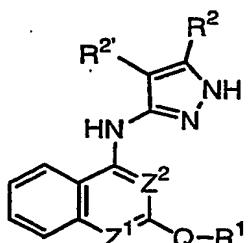

Those additional agents may be administered separately from the protein kinase inhibitor-containing composition, as part of a multiple dosage regimen. Alternatively, those agents may be part of a single 20 dosage form, mixed together with the protein kinase inhibitor of this invention in a single composition.

Compounds of this invention may exist in alternative tautomeric forms, as in tautomers *i* and *ii* shown below. Unless otherwise indicated, the 25 representation of either tautomer is meant to include the other.

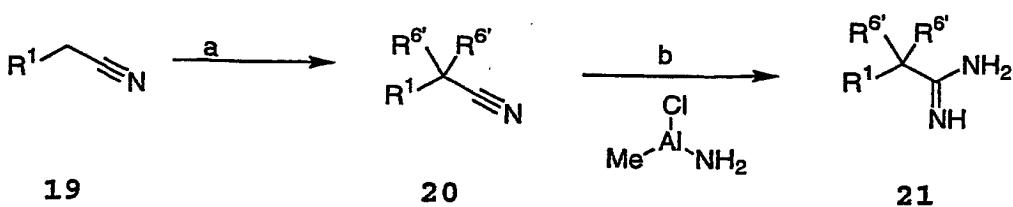

Scheme IV above shows a general route for the preparation of the present compounds wherein  $\text{R}^y$  is a group attached to the pyrimidine core via a nitrogen, oxygen or sulfur heteroatom. The starting 4,6-dihydroxy-2-methylsulfanylpyrimidine 10 may be prepared as described in *J. Med. Chem.*, 27, 12, 1621-1629 (1984). The chloro groups of intermediate 11 may be displaced sequentially with aminopyrazole (or aminoindazole) 2 and then with another amine (or alcohol or thiol) following procedures similar to those reported in US Patent 2585906 (ICI, 1949). The methylsulfanyl group of 13 may then be oxidized to provide the methylsulfone 14. Displacement of the methylsulfonyl group of 14 gives the desired product II.

Scheme VII

Scheme VII above shows a general method that may be used to prepare compounds of formula II wherein Q

-217-

is 1,2-cyclopropanediyl. Compound 26 may then be used to prepare the desired amino-pyrazole compounds using the methods described above at Scheme I step (b).

Method A. To a solution of 2,4-  
5 dichloroquinazoline (12.69g, 63mmol) and 3-amino-5-  
methylpyrazole (6.18g, 63mmol) in ethanol (220mL) is  
added triethylamine (8.13mL, 63mmol) and the reaction  
mixture is stirred for 3 hours at room temperature. The  
pale yellow precipitate is then collected by filtration,  
10 washed with cold ethanol and dried under vacuum to give  
(2-chloroquinazolin-4-yl)-(5-methyl-2H-pyrazol-3-yl)-  
amine.

The above-prepared (2-chloroquinazolin-4-yl)-  
(5-methyl-2H-pyrazol-3-yl)-amine (155 mg, 0.6 mmol) and  
15 3-chloroaniline (0.316 mL, 2.99 mmol) are refluxed in  
tert-butanol (3 mL) over 20 h. The mixture is  
concentrated *in vacuo* and the residue is suspended in  
EtOH/H<sub>2</sub>O (1mL/3mL). K<sub>2</sub>CO<sub>3</sub> (83 mg, 0.6 mmol) is added and  
the suspension is stirred for 2h at room temperature.  
20 The solid that forms is collected and dried under vacuum  
to give the product [2-(3-chlorophenylamino)-quinazolin-  
4-yl]-(5-methyl-2H-pyrazol-3-yl)-amine.

Method B. Sodium hydride (45 mg, 1.12 mmol) in  
THF (2 mL) is treated with 3-methoxyphenol (0.94g, 7.6  
25 mmol) and the reaction mixture is stirred until  
effervescence ceases. The THF is removed *in vacuo* and  
the above-prepared (2-chloroquinazolin-4-yl)-(5-methyl-  
2H-pyrazol-3-yl)-amine (150 mg, 0.51 mmol) is added.  
The reaction mixture is stirred at 100°C for 20 h, then  
30 poured into aqueous K<sub>2</sub>CO<sub>3</sub> and stirred for 2h at room  
temperature. The solid that forms is collected and re-  
crystallized from ethanol to give the product [2-(3-

-218-

methoxyphenoxy)-quinazolin-4-yl]-(5-methyl-2H-pyrazol-3-yl)-amine.

Method C. To a solution of 4-hydroxy-2-phenoxyethylquinazoline (2 g, 7.93 mmol) in phosphorus oxychloride (10mL) is added tripropylamine (3.02 mL, 15.8 mmol) and the reaction mixture is heated for 30 minutes at 110°C. The excess phosphorus oxychloride is evaporated *in vacuo*, the residue is poured on ice cold aqueous NaHCO<sub>3</sub>, and extracted with ethyl acetate. The 10 organic layer is washed with brine, dried, filtered and evaporated. The resulting residue is purified on flash chromatography (SiO<sub>2</sub>, hexane /AcOEt gradient) to give 4-chloro-2-phenoxyethylquinazoline.

To a solution of the above 4-chloro-2-phenoxyethylquinazoline (0.5 g, 1.85 mmol) in THF (30 mL) is added 3-amino-5-cyclopropylpyrazole (0.47 g, 3.69 mmol) and the reaction mixture is heated at 65°C for 24 hours. Solvent is evaporated and ethanol is added. A white solid forms and is collected by filtration and 20 dried under vacuum to give (5-cyclopropyl-2H-pyrazol-3-yl)-(2-phenoxyethyl-quinazolin-4-yl)-amine.

Method D. To a solution of the above-prepared (2-chloroquinazolin-4-yl)-(5-cyclopropyl-2H-pyrazol-3-yl)-amine (123 mg, 0.43 mmol) in THF (5 mL) is added 25 NiCl<sub>2</sub>(dppp) (12 mg, 2.1.10<sup>-5</sup> mol), followed by 1M benzylmagnesium chloride in THF (2.15 mL, 2.15 mmol). The solution is heated at 50°C for 20 hours and the reaction mixture is then quenched with aqueous NH<sub>4</sub>Cl and the product extracted in ethyl acetate. The solvent is 30 evaporated and the residue purified by flash chromatography to yield the desired (2-benzyl-quinazolin-4-yl)-(5-cyclopropyl-2H-pyrazol-3-yl)-amine.

-219-

Method E. A solution of (2-chloroquinazolin-4-yl)-(5-methyl-2H-pyrazol-3-yl)-amine (200 mg, 0.77 mmol) and 4-acetamidothiophenol (644 mg, 3.85 mmol) is refluxed in tert-butanol (3 mL) over a 20 hour period.

5 Diethylether (10 mL) is added to the mixture and a solid forms that is collected by filtration. This solid is suspended in ETOH/H<sub>2</sub>O 1mL/3mL), then K<sub>2</sub>CO<sub>3</sub> (110 mg, 0.8 mmol) is added and the suspension is stirred for 2h at room temperature. A solid forms and is collected and 10 dried under vacuum to give the product [2-(4-acetamidophenylsulfanyl)-quinazolin-4-yl]-(5-methyl-2H-pyrazol-3-yl)-amine.

Method F. To a solution of 2,4-dichloro-5,6,7,8-tetrahydroquinazoline (500 mg, 2.46 mmol) and 3-amino-5-cyclopropylpyrazole (303 mg, 2.46 mmol) in DMF (10mL) is added triethylamine (0.357 mL, 2.56 mmol) followed by sodium iodide (368 mg, 2.46 mmol) and the reaction mixture is heated at 90 °C for 20 h. The reaction mixture is partitioned between ethyl acetate and aqueous saturated NaHCO<sub>3</sub>. The organic layer is washed with brine and evaporated *in vacuo*. The residue is purified by flash chromatography (SiO<sub>2</sub>, hexane/AcOEt gradient) to give (2-chloro-5,6,7,8-tetrahydroquinazolin-4-yl)-(5-cyclopropyl-2H-pyrazol-3-yl)-amine.

#### BIOLOGICAL TESTING

The activity of the compounds as protein kinase 10 inhibitors may be assayed *in vitro*, *in vivo* or in a cell line. *In vitro* assays include assays that determine inhibition of either the phosphorylation activity or ATPase activity of the activated protein kinase. Alternate *in vitro* assays quantitate the ability of the 15 inhibitor to bind to the protein kinase. Inhibitor binding may be measured by radiolabelling the inhibitor prior to binding, isolating the inhibitor/protein kinase complex and determining the amount of radiolabel bound. Alternatively, inhibitor binding may be determined by 20 running a competition experiment where new inhibitors are incubated with the protein kinase bound to known radioligands.

##### 30 SRC INHIBITION ASSAY

The compounds were evaluated as inhibitors of human Src kinase using either a radioactivity-based assay or spectrophotometric assay.

-318-

Src Inhibition Assay A: Radioactivity-based Assay

The compounds were assayed as inhibitors of full length recombinant human Src kinase (from Upstate Biotechnology, cat. no. 14-117) expressed and purified 5 from baculo-viral cells. Src kinase activity was monitored by following the incorporation of  $^{33}\text{P}$  from ATP into the tyrosine of a random poly Glu-Tyr polymer substrate of composition, Glu:Tyr = 4:1 (Sigma, cat. no. P-0275). The following were the final concentrations of 10 the assay components: 0.05 M HEPES, pH 7.6, 10 mM MgCl<sub>2</sub>, 2 mM DTT, 0.25 mg/ml BSA, 10  $\mu\text{M}$  ATP (1-2  $\mu\text{Ci}$   $^{33}\text{P}$ -ATP per reaction), 5 mg/ml poly Glu-Tyr, and 1-2 units of recombinant human Src kinase. In a typical assay, all 15 the reaction components with the exception of ATP were pre-mixed and aliquoted into assay plate wells. Inhibitors dissolved in DMSO were added to the wells to give a final DMSO concentration of 2.5%. The assay plate was incubated at 30 °C for 10 min before initiating the reaction with  $^{33}\text{P}$ -ATP. After 20 min of reaction, the 20 reactions were quenched with 150  $\mu\text{l}$  of 10% trichloroacetic acid (TCA) containing 20 mM Na<sub>3</sub>PO<sub>4</sub>. The quenched samples were then transferred to a 96-well filter plate (Whatman, UNI-Filter GF/F Glass Fiber Filter, cat no. 7700-3310) installed on a filter plate 25 vacuum manifold. Filter plates were washed four times with 10% TCA containing 20 mM Na<sub>3</sub>PO<sub>4</sub> and then 4 times with methanol. 200 $\mu\text{l}$  of scintillation fluid was then added to each well. The plates were sealed and the amount of radioactivity associated with the filters was quantified 30 on a TopCount scintillation counter. The radioactivity incorporated was plotted as a function of the inhibitor concentration. The data was fitted to a competitive inhibition kinetics model to get the K<sub>i</sub> for the compound.

-319-

Src Inhibition Assay B: Spectrophotometric Assay

The ADP produced from ATP by the human recombinant Src kinase-catalyzed phosphorylation of poly Glu-Tyr substrate was quantified using a coupled enzyme assay (Fox et al (1998) *Protein Sci* 7, 2249). In this assay one molecule of NADH is oxidised to NAD for every molecule of ADP produced in the kinase reaction. The disappearance of NADH can be conveniently followed at 340 nm.

The following were the final concentrations of the assay components: 0.025 M HEPES, pH 7.6, 10 mM MgCl<sub>2</sub>, 2 mM DTT, 0.25 mg/ml poly Glu-Tyr, and 25 nM of recombinant human Src kinase. Final concentrations of the components of the coupled enzyme system were 2.5 mM phosphoenolpyruvate, 200  $\mu$ M NADH, 30  $\mu$ g/ml pyruvate kinase and 10  $\mu$ g/ml lactate dehydrogenase.

In a typical assay, all the reaction components with the exception of ATP were pre-mixed and aliquoted into assay plate wells. Inhibitors dissolved in DMSO were added to the wells to give a final DMSO concentration of 2.5%. The assay plate was incubated at 30°C for 10 min before initiating the reaction with 100  $\mu$ M ATP. The absorbance change at 340 nm with time, the rate of the reaction, was monitored on a molecular devices plate reader. The data of rate as a function of the inhibitor concentration was fitted to competitive inhibition kinetics model to get the  $K_i$  for the compound.

The following compounds were shown to have a  $K_i$  value of <100nM on SRC: IIa-8, IIa-21, IIa-23, IIa-24, IIa-27, IIa-28, IIa-30 through IIa-33, IIb-1, IIb-4, IIb-5, IIc-3, IIc-8, IIc-10, IIc-13, IIc-15, IIc-18, IIc-19, IIc-21 through IIc-24, IIc-31 through IIc-35, IIc-37

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 01/51031

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  

Although claims 11-27 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compounds.
2.  Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
